Hanover, N. H.
March 3. 1891 -

My dear Watson,
Have you time & patience to run through the big lot of truck I send you & help me to settle the following points?
1. Your note of 1887 determined an Arabis found here on both sides of the river occasionally as Arabis perfoliata & Brainerd says the same? But the seeds of some I send are margined & the pods rather loose & spreading - Have we both perfoliata & your confinis or may it not all be the latter?
Is / Hall's Arabis rightly ticketed by me?
2. Vitis - Shall I include both riparia & cordifolia in our flora? or if one which? Engelmann said the first; I think yours say the other

As to V. aestivalis, I am not here to look after it, but I think I have seen it, while the species Labrusca tho' not wild is around all old houses.

3. Myosotis. My Herb. specimens are in a muddle can you straighten out the names –

4. What aster is it I send? A tall plant 3½ ft high or more – very much branched with flowers varying from white to purple.
Have I sent you two kinds or is it all one? I used to call the most of these large plants a form of A. simplex. The smaller ones look like what I have had named for me.

A. tenuifolius – I cannot distinguish them any more than I can the sp. of Arabis.

Yours truly
Henry G. Jesup.

I'm going to print a list of the plants of Spring & early Summer for my classes & work up the full Catalogue gradually for next fall.
